Leading Technology Shining Value

Motion Control Products 2012 / 2013

- Stepper Motors & Drives
- Easy Servos
- Servo Motors & Drives
- Power Supplies
- Motion Controllers

Note: Product appearance and technical parameters are subject to change without notice.

Leadshine Motion Control Products 2012 / 2013

Company Overview

Founded in 1997, Leadshine Motion Technology Ltd. specializes in developing, manufacturing, and distributing high-quality cost-effective motion control products. Its products include motion controllers, integrated and discrete stepper drives and motors, easy servos, DC servo products, AC servo products, and power supplies. Leadshine serves various industrial and OEM customers in Asia, Europe, North/South America, Africa and Australia.

Leadshine is one of the LARGEST manufacturers of motion control products around the world. Led by an MIT PhD graduate, Leadshine's R&D team of 80 talented engineers is capable of designing high-quality motion control products based on the latest technologies. Leadshine's manufacturing facilities are ISO-9001 certified and professionally staffed.

Leadshine is committed to provide its customers with world-class motion control products at highly competitive prices. "LEADING technology and SHINING value" is always what Leadshine intends to offer to its customers.

R&D

Leadshine is proud of its talented research & development team, which is one of the best in the motion control industry. We are capable of designing world-class products which can meet high requirements of our customers. Many innovative designs and products from Leadshine have been awarded for patents by Chinese government.

Product Quality

Leadshine has been awarded the ISO 9001 registration for quality management practices since September 2004. The certification is a testimony of Leadshine's commitment to provide its customers with high quality products and services.

Technical Support

Staffed with a highly professional and experienced technical support team, Leadshine can help its customers to increase productivity, reduce design & selection risks, and minimize the product development time. We are able to support our customers through email, telephone, field support, product studying conference, and some other approaches.

You can contact Leadshine technical support by phone at 86-755-2641-8447, by fax at 86-755-2640-2718, or by email at tech@leadshine.com.

Quality Products Selling Over 1,000,000 pcs/year!

Design & Verification

Since the formation in 1997, Leadshine has been investing heavily in research and development for the newest motion technology. Leadshine owns a large number of patents and copyrights on its hardware and software of its products. Before release to its customers, all Leadshine products have been verified and tested in Leadshine's state-of-the-art laboratory.

Quality Assurance

All Leadshine's products have to pass QC and 24-hour aging test, making the usual return & repair rate is under 0.5%. And that is why Leadshine can offer **LONGER** warranty period (18 months) than most other motion control product manufacturers.

Assembly Line

Leadshine product quality is guaranteed by an ISO-certified manufacturing system which includes rigorous supplier selection, incoming parts QC, in-process QC, final QA, and 24-hour aging test. The certification is a testimony of Leadshine's commitment to provide its customers with high quality products and services.

Support & Service

Leadshine's professional and experienced technical team can help customers to reduce design and selection risks, and minimize product development time through support of email, field support, exhibitions, product studying conference, etc.

Innovative Products with High Reliability

Currently, Leadshine offers three main series of 2-phase microstepping drives, the digital EM series, DM series and analog M series. The high performance DM drives are based on powerful 32-bit DSP control technology. Their features include super-low stepper noise, anti-resonance, low-speed ripple smoothing, and low motor heating. The EM series drives are leadshine's highest performance discrete stepper drives. They adopt more innovative technologies than the DM series, thus have more features, such as sensorless stall detection, user password protection, etc. The low-cost M drives employ precise analog current control and are characterized by extra high-speed torque, relatively low stepper noise, and low motor heating. Leadshine also supplies 3-phase digital and analog stepper drives.

Leadshine's iST series integrated stepper systems are one of the most compact stepper drive and motor package on the market. An iST integrated stepper has a stepper motor integrated with an advanced DSP based stepper drive. At very compact size and with all components integrated, the iST series steppers can save mounting space, and motor wiring time, reduce interference, and lower cable and labour cost.

Leadshine offers 2-phase and 3-phase stepper motors from NEMA frame size 14 to 51. Made of high quality cold roll sheet copper and anti-high temperature permanent magnet, Leadshine's stepper motors are highly reliable and generate low motor heating. Because of their nice internal damping characteristics, those stepper motors can run very smoothly and have no obvious resonance area within the whole speed ranges.

World-class Products at Highly Competitive Prices

Leadshine's easy servos adopt hybrid motion technology prevent loss of synchronization due to transient, continued overload, extreme acceleration or deceleration, or excessive slew speed, thus can significantly improve the performance and reliability of your motion control systems. This series servos do not need time consuming servo tuning and do not have hunting at standstill like a conventional servo.

Easy Servos

ES Series Easy Servos	51
------------------------------------	----

Leadshine's iES series easy servos are highly integrated easy servo systems. An iES integrated easy servo has an easy servo motor and an easy servo drive. At very compact size and with all components integrated, the iES series easy servos can save mounting space, eliminate encoder connection and motor wiring time, reduce interference, and lower cable and labour cost. This series servos do not need time consuming servo tuning and do not have hunting at standstill like a conventional servo.

 DMC1000B ----- 111
 DMC2410B ----- 113
 DMC5480 ----- 115
 ENC7480 ----- 117
 SMC6480 ----- 119
 SMC6400B ----- 121

Leadshine's full line of motion controllers includes single and multi-axis, bus-based and stand-alone controllers. Available interface options for international markets include PCI, USB, RS232 and Ethernet for the moment. These controllers provide high speed performance and can handle many modes of motion such as point-to-point positioning, jogging, linear and circular interpolation, continuous interpolation and helix interpolation.

Basic Components of Motion Control System

Many different components are used in a variety of combinations to create a modern motion control system. Usually, the system will be comprised of the following basic elements: controller, drive/amplifier, actuator. And for a more integrated motion control system will be comprised of feedback, operator interface and host, besides elements mentioned above. A simplified block diagram of a motion control system would appear as shown below.

* Operator Interface and Host

Operator interface and host are/is present to input control logic, modify programs, or provide real time operations, such as system shut down or schedule changes.

* Controller

The controller acts as brain of the system by taking the desired target positions and motion profiles and creating the trajectories for the motors to follow. It will include a means of entering a set of instructions or code into its memory which are then translated into a series of electrical pulses or analog signals and output to a drive for controlling some type of actuator.

* Drive/Amplifier

The drive/amplifier receives the signals from the controller and generate the current required to drive or turn the actuator.

* Actuator

The actuator provides the actual physical motion and will be closely coupled to the design characteristics of the drive. The drive/actuator set may be any one of several different design classifications. Typically, but by no means always, they will the form of an electronic drive and an electric motor. Other common means of motion are pneumatic or hydraulic actuators.

* Feedback Device

There are a wide variety of feedback devices that are commonly used in motion control systems today which provide information on linear or rotary motion, such as optical encoders, magnetic encoders and resolvers.

Selection Guide for Discrete Stepper Drives

A stepper motor requires an electrical sequencer and it is called a stepper drive. The stepper drive is one of the key components in a stepper system. When you select a stepper drive for the special application, you can follow the following steps. Firstly, you should choose the drive type and determine the drive operating mode. Secondly, choose right supply voltage and output current according with the application and the motor. In the end, you should consider whether the acceptable control signals of the drive are right for those of your motion controller or not. Of course, the price of the chose drive should be acceptable too.

Drive Types

The output torque and power from a stepper motor are determined by the operating current, motor size, motor heat sinking, motor winding, and the type of the drive used. You can get much different performances from a given motor by choosing different type stepper drives.

There are some commonly-used drive types, such as unipolar constant voltage drive, unipolar L/nR constant voltage drive, unipolar timed bi-level drive, unipolar constant current drive, unipolar constant current drive and bipolar constant current microstepper drive. The highest output power and motor utilization for a given motor is achieved with the bipolar constant current drive. DC-losses is kept at a minimum due to maximum utilization of the copper in the winding and no power losses from leakage inductance and snubbing circuits since every winding only consists of one part.

Bipolar constant current microstepper drive is an improved version of the basic full- and half-step bipolar constant-current drive. Here, the winding currents form a sine/cosine pair. This greatly improves low frequency performances by eliminating overshoot movements, ringing, and resonances. Performances at medium and high-stepper rates are close to those of full- and half-step. This drive uses the same power stage as the bipolar constant-current drive, but extra electronics for setting the sine/cosine current levels are used. Microstepper can also increase resolution and step accuracy of the stepper systems.

Supply Voltage and Output Current

Although both regulated and unregulated power supplies can be used to power the drives, unregulated power supplies are preferred due to their ability to withstand current surge. The power supply voltage must be within the drive's allowable operating voltage range. Beyond that, the choice of voltage is dependent on the application and the motor used.

Higher supply voltage can increase motor torque at higher speeds, being helpful for avoiding losing steps. However, higher voltage may cause bigger motor vibration at lower speed, and may also cause over-voltage protection or even drive damage. Therefore, it is suggested to choose only a sufficiently high supply voltage for intended application, and use power supplies with theoretical output voltage of at least 10% below drive's maximum input voltage, leaving room for power fluctuation and back-EMF.

For a given motor, higher drive current will make the motor output more torque, but it also causes more heating in the motor and the drive. Therefore, output current is generally set to be such that the motor will not overheat for long time operation. Phase current rating supplied by motor manufacturer is important when setting a drives output current, however the setting also depends on the leads and motor connections. Since parallel and serial connections of motor coils will significantly change the resulting inductance and resistance, it is important to set drive output current based on motor's phase current and connection types.

Leadshine's stepper drives cover a broad operating voltage range, from 18 to 312VDC or 18 to 220VAC. And most of Leadshine's stepper drives have over-voltage and over-current protection functions. All of Leadshine's stepper drives use DIP switches to set motor's operating current, and all of them have automatic idle-current reduction function.

Drive Modes

The most common drive modes are full-step, half-step and microstepping.

FULL-STEP MODE: This is the basic stepper driving mode, it offers the simplest control electronics and it is recommended for high and medium frequency operation. At these frequencies, the inertia of the motor and the load smooth out the torque, resulting in less vibration and noise compared to low-speed operation.

HALF-STEP MODE: Half-step gives smoother movement at low step rates compared to full-step and can be used to lower resonances at low speeds. Half-step doubles the system resolution. Observe that for most stepper motors, the step accuracy specification only is valid for 2-phase-on positions. The accuracy is lower and the stop-position hysteresis is larger for 1-phase-on positions.

Microstepping: The smoothest movement at low frequencies can be achieved with microstepping. If resonance-free movement at low step rates is important, the microstepping drive is the best choice. Microstepping can also be used to increase stop position accuracy beyond the normal motor limits.

Leadshine's stepper drives cover all drive modes. Both our digital stepper drives and analog stepper drives can operate in full-step, half-step and microstepping modes.

Introduction

Since releasing its first stepper drive in 1997, Leadshine has been designing stepper drives to satisfy the requirements of its customers. Today, Leadshine is one of the **LARGEST** stepper drive manufacturers in the world. Every year, over **900,000** Leadshine stepper drives are implemented in thousands of applications around the world. The applications include CNC routers, laser machines, electronic equipment, packaging equipment, textile equipment, pick-and-place device, etc.

Currently, Leadshine offers three main series of 2-phase microstepping drives, the digital EM series, DM series and analog M series. The high performance DM drives are based on powerful 32-bit DSP control technology. Their features include super-low stepper noise, anti-resonance, low-speed ripple smoothing, and low motor heating. The EM series drives are leadshine's highest performance discrete stepper drives. They adopt more innovative technologies than the DM series, thus have more features, such as sensorless stall detection, user password protection, etc. The low-cost M drives employ precise analog current control and are characterized by superior high-speed torque, relatively low stepper noise, and low motor heating. Leadshine also supplies 3-phase digital and analog

Selection Table

Phase	Series	Model	Output Current (A)	Operating Voltage (V)	Microstep Resolution	Driving Motors (NEMA Size)	Weight (kg)	Size (mm)	Control Signals		
									PUL/DIR; CW/CCW	Single-ended; Differential	
2	EM	EM402	0.3 - 2.2	DC(20-40)	1-512	14, 17, 23	0.12	86*55*20	PUL/DIR;	Single-ended; Differential

	3	DM	MA860H	2.4 - 7.2	AC(24-80)	2-256, 5-200	34, 42	0.65	151*97*52	PUL/DIR; CW/CCW	Single-ended; Differential
			3DM683	0.5 - 8.3	DC(18-60)	200-51200s/r	17, 23, 34	0.30	118*75.5*34	PUL/DIR; CW/CCW	Single-ended; Differential

Note: Please contact Leadshine or visit www.leadshine.com for information about other drives.

Part Number

* This model has UL approved version and non-UL approved version.
 ** Command sources include step/direction, analog(0-5V).
 *** For EM series drives, it's maximum RMS current.

EM Series Digital Stepper Drives

Sensorless stall detection and Super-low motor noise

Innovative Technologies

- Sensorless Stall Detection
- Super-low Motor Noise
- User Password Protection
- Anti-Resonance Technology
- Low-speed Ripple Smoothing
- Multi-stepping Technology
- Soft Start Technology
- Self-test and Auto-setup

Specifications

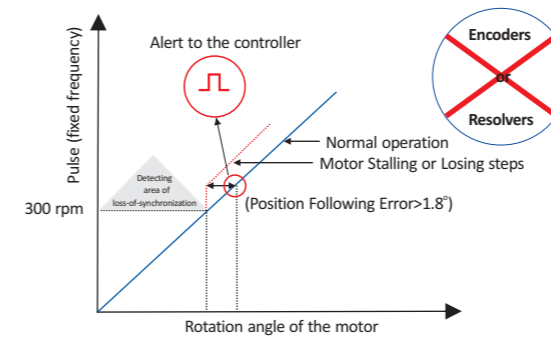

Type	Model	Voltage	RMS Cur.	Matching Motors
DC Input	EM402	20-40 VDC	0.07-1.6A	NEMA8 to 23
	EM503	20-50 VDC	0.21-3.0A	NEMA14 to 23
	EM705	20-78 VDC	0.35-5.7A	NEMA17 to 34
	EM806	24-80 VDC	0.35-6.0A	NEMA23 to 34
AC Input	EM1206H*	80-150 VAC	0.35-6.0A	NEMA34 to 42
	EM2306H*	80-230 VAC	0.35-6.0A	NEMA34 to 51

● Over voltage, over current, short-circuit protections and fault out.
 *Available time: to be determined.

Innovative Technologies

1 Sensorless Stall Detection

By detecting motor voltage, current, and back-emf signal, EM series drives can detect loss-of-synchronization of stepper motors without encoders. The sensorless stall detection eliminates cost of feedback devices and time of cable connection.

2 Super-low Motor Noise

Precision current control technology and multi-stepping technology can reduce about 70% motor noise, making the EM series to be an ideal solution for the applications require low motor noise.

4 Anti-Resonance at Mid-range

Most stepper systems resonate at mid-range speed between 10 to 18 rps. EM stepper drives can calculate natural frequency of the stepper system and apply damping in control algorithm for anti-resonance, Providing optimizing torque and nulling mid-range instability.

3 Low-speed Ripple Smoothing

Electronic damping for 3 major resonance frequencies for stepper motors at low speed range, eliminating undesirable motor speed oscillation and delivering unique level of smoothness.

5 Multi-stepping Technology

Multi-stepping allows a low resolution input to produce a higher microstep output for smoother system performance. This function can improve smoothness of the stepper systems without upgrading your motion controllers.

6 Command Signal Smoothing

Command signal smoothing can soften the effect of sudden changes in velocity and direction, thus delivering smoother performance and improving system lifetime.

7 Soft Start Technology

On power up of a stepper motor, soft start technology allows a stepper motor gradually applying the shaft torque to the load and avoid "starting shock" to the machine. This function is implemented through software, so no additional hardware needed.

8 Lower Heating Technology

Due to DSP precision current control algorithm, motor heat is 10–20 °C lower compare to a traditional stepper drive. Longer motor lifetime can be achieved, reducing maintenance cost. Drive heat is also 20% lower, offering higher drive stability and energy efficiency.

9 Torque Improvement

Torque improvement increases torque up to 30% at high speed, therefore they can drive a normal stepper motor to 3000 RPM or even higher, and significantly increase production efficiency.

10 Self-test and Auto-configuration

Motor-self-test and parameter-auto-configuration technology offers optimum performance for different motors. It is easier for users to configure different axes or build different machines.

Turn SW4 2 times switch in 1 second.

11 User Password Protection

User password protection allows you to prevent others from copying your stepper drive configuration.

Features

- **Sensorless stall detection** eliminates cost of feedback devices and time of cable connection
- **Super-low motor noise** offers excellent quietness
- **User password protection** prevents others from copying your drive configurations
- **Anti-Resonance** optimizes torque and nulls mid-range instability
- **Self-test and Auto-configuration** technology offers optimum performance for different motors
- **Multi-stepping** allows a low resolution input to produce a higher microstep output for smoother system performance
- Built-in controller for simple test, easier to test the drive or system
- Options to set output current and microstep resolutions via DIP switch or software
- Command input of step&direction and CW/CCW pulse*
- Over-current, over-voltage, short-circuit protections besides sensorless stall detection
- **Fault out** prevents damages to your machines or the materials

Introduction

By implementing the latest motion control technologies, Leadshine's EM series DSP-based stepper drives deliver excellent performance not available before. Unique features of sensorless stall detection, extra smoothness and excellent high speed performance make EM stepper drives deliver servo-like performance at the cost of stepper drives. They are capable of delivering high performance without damages to your machines or the materials. Leadshine EM series stepper drives are able to drive 2-phase stepper motors from NEMA8 to NEMA51.

Part Number

Applications

Leadshine EM stepper drives are suitable for driving a wide range of stepper motors, from NEMA frame size 8 to 51. Typical applications include CNC routers, laser cutters, laser markers, medical equipments, X-Y tables, measurement equipments, etc.

Pin Assignment

There are two connector types for an EM stepper drive. Connector type P1 (See figure below.) is for control signal connections, and connector type P2 is for power and motor connections. The RS232 communication port is for parameter configurations via computer. See brief descriptions for these connectors and interface below.

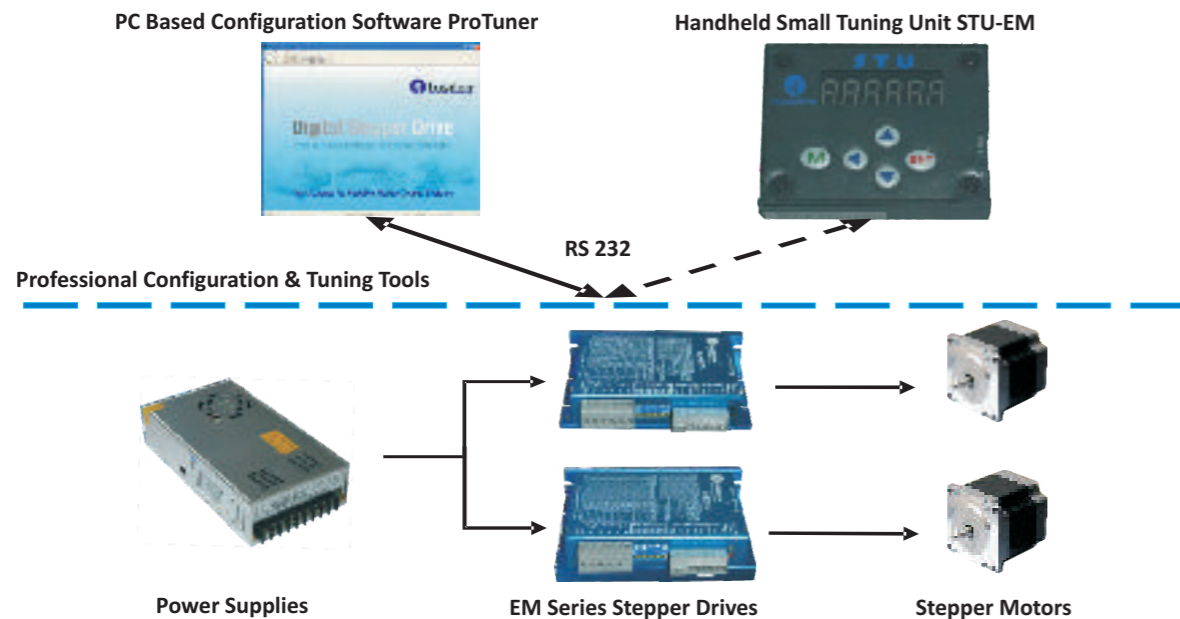

Tips:

- Users are suggested to use motor **self-test and auto-configuration** function when powering up the system (with the motor) for the first time, or replacing a new motor.
- To operate at current and microstep settings configured by software or STU, DIP switch must set to default mode.
- Only software **ProTuner** can be used to configure anti-resonance parameter settings.
- How many times the RED light blinks on in a periodic time indicates what protection has been activated. See manuals for detail.

PC Based and Handheld Configuration/Tuning Tools

For most of applications, configurations set by self-test and auto-configuration function should be good enough to meet the application requirements. However, a user can also configure the advanced features such as anti-resonance and advanced current loop tuning through software or STU-EM, a simple device specially designed for easy tuning.

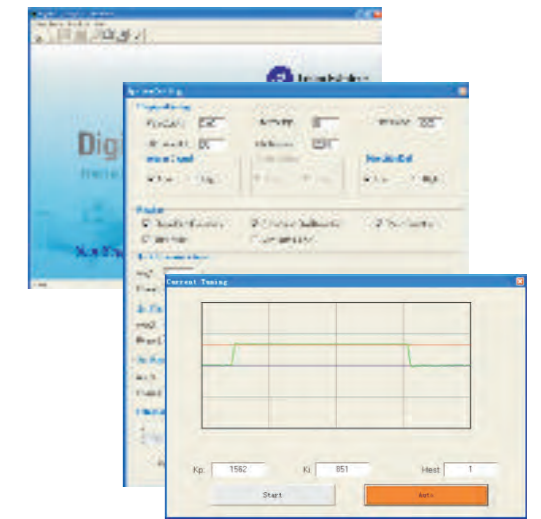

ProTuner (Windows Based Setup Software)

- User password setting
- Upload and Download parameter settings
- PI parameter settings for current loop
- Microstep resolution and output current setting
- Electronic damping coefficient setting
- Anti-resonance parameter settings for 3 resonance areas
- DIR and ALM logic level setting
- Enable and disable sensorless stall detection, ENA reset function and command signal smoothing
- Parameter settings for self motion test
- Save, open, upload and download a configuration file
- Read the latest 10 failure events and clear these events

* 1 PC RS232 interface is necessary.

** Leadshine offers special cable for communication between ProTuner and the drive.

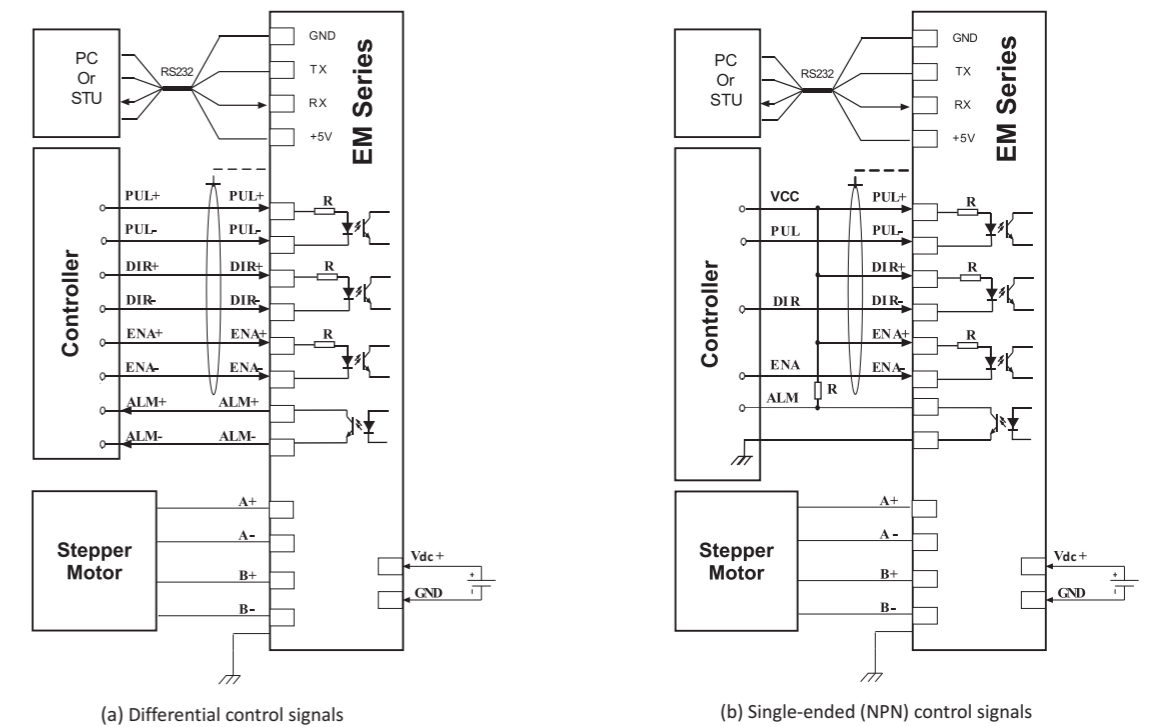

STU-EM (Handheld Configuration and Tuning Unit)

- Upload and Download parameter settings
- PI parameter settings for current loop
- Microstep resolution and output current setting
- Electronic damping coefficient setting
- DIR and ALM logic level setting
- Enable and disable sensorless stall detection, ENA reset function and command signal smoothing
- Parameter settings for self motion test
- Upload and download a configuration file

* Leadshine offers special cable for communication between the STU-EM and the drive.

Typical Connections

Speed-Torque Curves of Pre-set Matching Motors*

* Other curves will be released soon.

Mechanical Specifications (Unit: mm 1 inch=25.4mm)

Units: mm 1 inch=25.4mm

DM Series Digital Stepper Drives

Innovative Technologies

Low-speed Ripple Smoothing

Electronic damping for 3 major resonance frequencies for stepper motors at low speed range, eliminating undesirable motor speed oscillation and delivering unique level of smoothness.

Super Low Noise

Precision current control technology and multi-stepping technology can reduce about 70% motor noise, making the EM series to be an ideal solution for the applications require low motor noise.

Anti-Resonance at Mid-range

Most stepper systems resonate at mid-range speed between 10 to 18 rps. EM stepper drives can calculate natural frequency of the stepper system and apply damping in control algorithm for anti-resonance, Providing optimizing torque and nulling mid-range instability.

Multi-Stepping Technology

Multi-stepping allows a low resolution input to produce a higher microstep output for smoother system performance. This function can improve smoothness of the stepper systems without upgrading your motion controllers.

Lower Motor Heating

Due to DSP precision current control algorithm, motor heat is 10 – 20 °C lower compare to a traditional stepper drive. Longer motor lifetime can be achieved, reducing maintenance cost.

Lower Drive Heating

Drive heat is also 20% lower, offering higher drive stability and energy efficiency.

Command Signal Smoothing

Command signal smoothing can soften the effect of sudden changes in velocity and direction, thus delivering smoother performance and improving system lifetime.

Torque Improving

Torque improvement increases torque up to 30% at high speed, therefore they can drive a normal stepper motor to 3000 RPM or even higher, and significantly increase production efficiency.

Self-test and Auto-setup

Motor-self-test and parameter-auto-configuration technology offers optimum performance for different motors. It is easier for users to configure different axes or build different machines.

Features

- **Anti-Resonance** optimizes torque and nulls mid-range instability
- **Self-test and Auto-configuration** technology offers optimum performance for different motors
- **Multi-stepping** allows a low resolution input to produce a higher microstep output for smoother system performance
- 2-phase and 3-phase stepper drives are available
- Options to set output current and microstep resolutions via DIP switch or software
- Command input of PUL/DIR and CW/CCW
- Over-current, over-voltage, short-circuit protections

Introduction

By implementing the latest motion control technologies, Leadshine's DM series DSP-based stepper drives deliver excellent performance not available before. Unique features of extra smoothness and excellent high speed performance make DM stepper drives deliver servo-like performance at the cost of stepper drives. They are capable of delivering high performance without damages to your machines or the materials. Leadshine DM series stepper drives are able to drive 2-phase or 3-phase stepper motors from NEMA8 to NEMA42.

Applications

Leadshine DM stepper drives are suitable for driving a wide range of stepper motors, from NEMA frame size 8 to 42. Typical applications include CNC routers, laser cutters, laser markers, medical equipments, X-Y tables, measurement equipments, etc.

Electrical Specifications

Parameters	Input Voltage (VDC)			Output Current (A)		
	Min	Typical	Max	Min	Typical	Max
Model						
DM320C	+18	+24	+30	0.3	-	2.0
DM422C	+18	+24	+40	0.3	-	2.2
DM442	+18	+36	+40	0.5	-	4.2
DM556	+18	+36	+50	0.5	-	5.6
DM870	+18	+60	+80	0.5	-	7.0
DM1182	80 (VAC)	120 (VAC)	150 (VAC)	0.5	-	8.2
DM2282	80 (VAC)	230 (VAC)	240 (VAC)	0.5	-	8.2
3DM683	+18	+48	+60	0.5	-	8.2
DM805-AI	+18	+60	+80	0.5	-	7.0

Parameters	Pulse Input Frequency (kHz)			Logic Signal Current (mA)			Isolation Resistance (MΩ)		
	Min	Typical	Max	Min	Typical	Max	Min	Typical	Max
Model									
DM Series	0	-	300**	7	10	16	500	-	-

* This model has UL approved version and non-UL approved version.
 ** Those of the DM320C and DM422C are 75 kHz, and that of the DM442 is 200 kHz.

Pin Assignment and Description

There are two connector types for a DM stepper drive. Connector type P1 (See figure below.) is for control signal connections, and connector type P2 is for power and motor connections. The RS232 communication port is for parameter configurations via computer. See brief descriptions for these connectors and interface below.

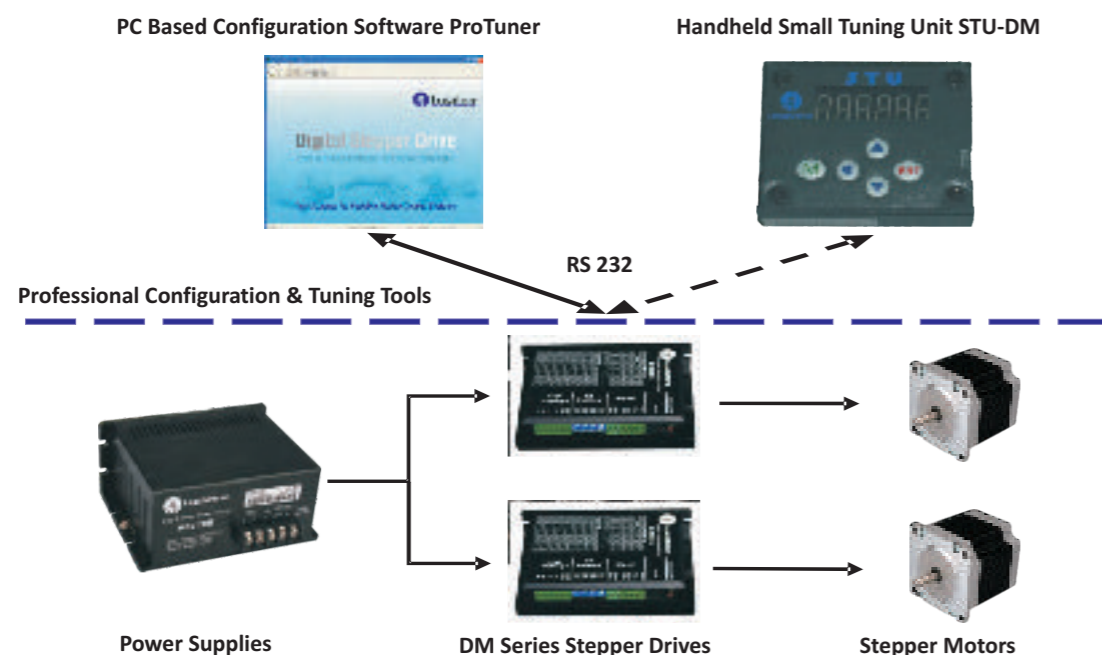

Tips:

1. Users are suggested to use motor **self-test and auto-configuration** function when powering up the system (with the motor) for the first time, or replacing a new motor.
2. To operate at current and microstep settings configured by software or STU, DIP switch must set to default mode.
3. Only software **ProTuner** can be used to configure anti-resonance parameter settings.
4. How many times the RED light blinks on in a periodic time indicates what protection has been activated. See manuals for detail.

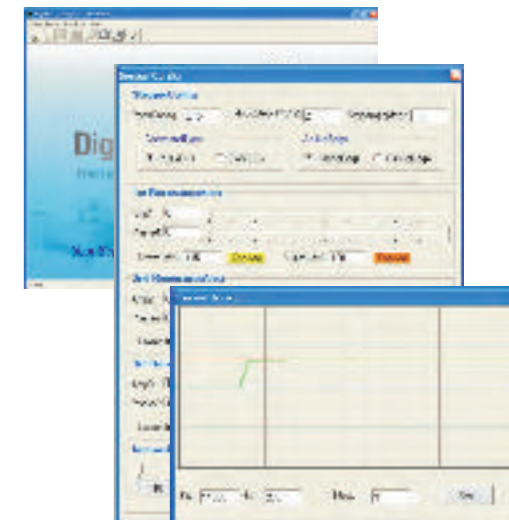

PC Based and Handheld Configuration & Tuning Tools

For most of applications, configurations set by self-test and auto-configuration function should be good enough to meet the application requirements. However, a user can also configure the advanced features such as anti-resonance and advanced current loop tuning through software or STU-DM, a simple device specially designed for easy tuning.

ProTuner (Windows Based Setup Software)

- Upload and Download parameter settings
- PI parameter settings for current loop
- Microstep resolution and output current settings
- Operation mode configuration :PUL/DIR, CW/CCW, analog*
- DIR logic level setting
- Active edge of pulse signal setting
- Electronic damping coefficient setting
- Anti-resonance parameter settings for 3 resonance area
- Parameter settings for self motion test or a simple application
- Read the latest 10 failure events and clear these events

* 1 PC RS232 interface is necessary.
** Leadshine offers special cable for communication between ProTuner and the drive.

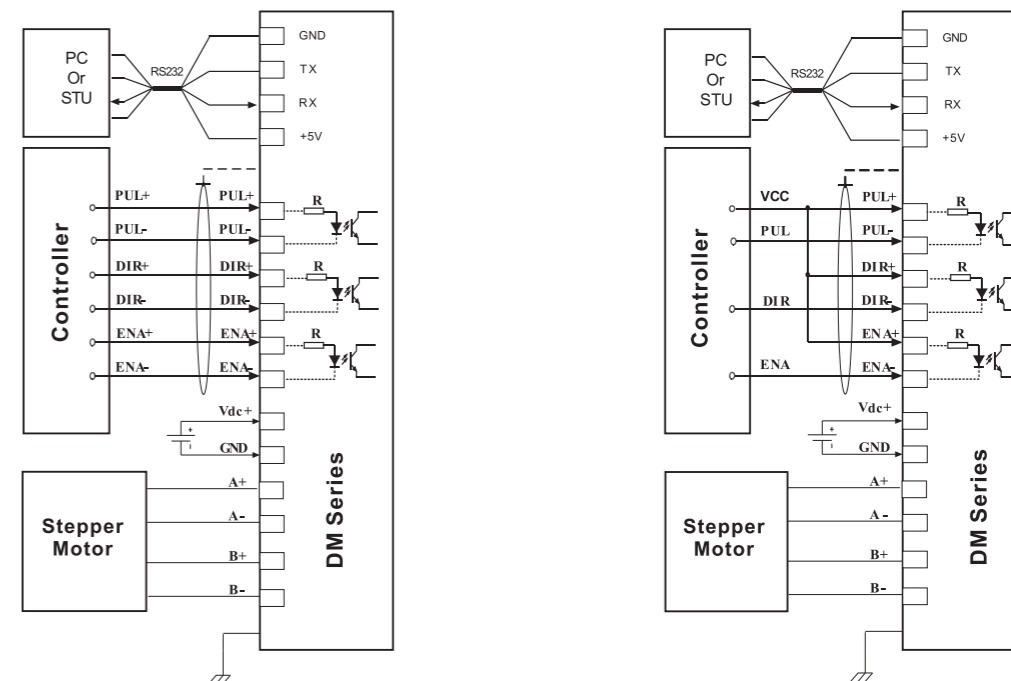

STU-DM (Handheld Configuration and Tuning Unit)

- Upload and Download parameter settings
- PI parameter settings for current loop
- Microstep resolution and output current settings
- Operation mode configuration :PUL/DIR, CW/CCW, analog*
- DIR logic level setting
- Active edge of pulse signal setting
- Parameter settings for self motion test or a simple application

* Leadshine offers special cable for communication between the STU-DM and the drive.

Typical Connections

(a) Differential control signals
* Only DM805-AI support analog command for the moment.

DM422C

Introduction

The DM422C is a versatility fully digital stepper drive based on a DSP with advanced control algorithm. It brings a unique level of system smoothness, providing optimum torque and nulls mid-range instability. Motor auto-identification and parameter auto-configuration technology offers optimum response with different motors. The driven motors can run with much lower noise, lower heating, smoother movement than most stepper drives on the market.

Applications

Suitable for a wide range of stepper motors, from NEMA8 to NEMA23. It can be used in various kinds of machines, such as medical machines, laser cutters, laser markers, high precision X-Y tables, labelling machines, and so on. Its unique features make the DM422C an ideal solution for applications that require low-speed smoothness.

Function Description

Function	Description
Microstep Setting	Microstep resolution is programmable. When not in software configured mode, microstep resolution is set by SW5, 6 of the DIP switch. In order to avoid losing steps, do not change the microstep resolution on the fly.
Current Setting	Output current is programmable. When not in software configured mode, operating current is set by SW1,2,3 of the DIP switch. Up to 2.2A. Select a current setting closest to your motor's required current.
Automatic standstill current reduction;	SW4 is used for the automatic standstill current reduction, self-test and auto-configuration function. When the former active, the current will automatically reduced to 60% of the selected operating current 0.4 second after the last pulse. Theoretically, this will reduce motor heating to 36% (due to $P=I^2 \cdot R$) of the original value.
Self-test and auto-configuration	If the user changes the status/position of SW4 twice in 1 second, the drive will self-test the driving motor and auto-configuration control parameters, offering optimum performance with different motors..
Control Signals	OPTO is for the opto-coupler power supply, typically+5V. PUL is for the pulse command signal. DIR is for the direction control signal. ENA is for the enable/ disable control signal. Series connect resistors for current-limiting when +12V or +24V is used.
Motor Connector	A+, A- and B+, B- are for motor connections. Exchanging the connection of two wires for a coil to the drive will reverse default motion direction.
Power Connector	Recommended to use power supplies with output of 18 to 36 VDC, leaving room for power fluctuation and back-EMF.
Indicators	There are two LED indicators on the drive for power and alarm signals. When the Green LED is on means the drive is powered up, and when the Red LED is on means the drive is in fault status. When in fault status, the motor shaft will be free. Reset the drive by re-powering it to make it function properly after removing problem(s). See its manual for more information.

Parameter Settings

Microstep resolution and output current are programmable. When not in software configured mode, the drive uses a 6-bit DIP switch to set microstep resolution, and motor operating current, as shown below:

Operating Current Setting

Peak Current	RMS Current	SW1	SW2	SW3
Default (software configured, 0.3-2.2 A)				
0.5 A	0.35 A	off	on	on
0.7 A	0.5 A	on	off	on
1.0 A	0.7 A	off	off	on
1.3 A	0.9 A	on	on	off
1.6 A	1.2 A	off	on	off
1.9 A	1.4 A	on	off	off
2.2 A	1.6 A	off	off	off

Mechanical Specifications

Units: mm 1inch = 25.4mm

Microstep Resolution Setting

Steps/rev.	SW5	SW6
Default (software configured, 1-512)		
1600	off	on
3200	on	off
6400	off	off

DM556

Introduction

The DM556 is a versatility fully digital stepper drive based on a DSP with advanced control algorithm. It brings a unique level of system smoothness, providing optimum torque, nulls mid-range instability and good high speed performance. Motor auto-identification and parameter auto-configuration technology offers optimum response with different motors. The driven motors can run with much lower noise, lower heating, smoother movement than most stepper drives on the market.

Applications

Suitable for a wide range of stepper motors, from NEMA17 to NEMA34. It can be used in various kinds of machines, such as medical machines, laser cutters, laser markers, high precision X-Y tables, labelling machines, and so on. Its unique features make the DM556 an ideal solution for applications that require low-speed smoothness and good high speed performance..

Function Description

Function	Description
Microstep Setting	Microstep resolutions is programmable. When not in software configured mode, microstep resolution is set by SW5, 6, 7, 8 of the DIP switch. In order to avoid losing steps, do not change the microstep resolution on the fly.
Current Setting	Output current is programmable. When it's not in software configured mode, operating current is set by SW1,2,3 of the DIP switch. Up to 5.6 A. Select a current setting closest to your motor's required current.
Automatic standstill current reduction;	SW4 is used for the automatic standstill current reduction, self-test and auto-configuration function. When the former active, the current will automatically reduced to 60% of the selected operating current 0.4 second after the last pulse. Theoretically, this will reduce motor heating to 36% (due to $P=I^2 \cdot R$) of the original value.
Self-test and auto-configuration	If the user changes the status/position of SW4 twice in 1 second, the drive will self-test the driving motor and auto-configuration control parameters, offering optimum performance with different motors..
Control Signals	PUL+ and PUL- are for the pulse command signal. DIR+ and DIR- are for the direction control signal. ENA+ and ENA- are for the enable/disable control signal. Series connect resistors for current-limiting when +12V or +24V is used.
Motor Connector	A+, A- and B+, B- are for motor connections. Exchanging the connection of two wires for a coil to the drive will reverse default motion direction.
Power Connector	Recommended to use power supplies with output of 20 to 45 VDC, leaving room for power fluctuation and back-EMF.
Indicators	There are two LED indicators on the drive for power and alarm signals. When the Green LED is on means the drive is powered up, and when the Red LED is on means the drive is in fault status. When in fault status, the motor shaft will be free. Reset the drive by re-powering it to make it function properly after removing problem(s). See its manual for more information.

Parameter Settings

Microstep resolution and output current are programmable. When not in software configured mode, the drive uses an 8-bit DIP switch to set microstep resolution, and motor operating current, as shown below:

Operating Current Setting

Peak Current	RMS Current	SW1	SW2	SW3
Default (software configured, 0.5-5.6 A)				
2.1 A	1.5 A	off	off	off
2.7 A	1.9 A	off	on	off

3DM683

Introduction

The 3DM683 is a versatility fully digital 3-phase stepper drive based on a DSP with advanced control algorithm. It brings a unique level of system smoothness, providing optimum torque, nulls mid-range instability and good high speed performance. Motor auto-identification and parameter auto-configuration technology offers optimum response with different motors. The driven motors can run with much lower noise, lower heating, smoother movement than most stepper drives on the market.

Applications

Suitable for a wide range of stepper motors, from NEMA17 to NEMA34. It can be used in various kinds of machines, such as medical machines, laser cutters, laser markers, high precision X-Y tables, labelling machines, and so on. Its unique features make the 3DM683 an ideal solution for applications that require low-speed smoothness and good high speed performance.

Function Description

Function	Description
Microstep Setting	Microstep resolution is programmable. When not in software configured mode, microstep resolution is set by SW5, 6, 7, 8 of the DIP switch. In order to avoid losing steps, do not change the microstep resolution on the fly.
Current Setting	Output current is programmable. When not in software configured mode, operating current is set by SW1,2,3 of the DIP switch. Up to 8.3 A. Select a current setting closest to your motor's required current.
Automatic standstill current reduction;	SW4 is used for the automatic standstill current reduction, self-test and auto-configuration function. When the former active, the current will automatically reduced to 60% of the selected operating current 0.4 second after the last pulse. Theoretically, this will reduce motor heating to 36% (due to $P=I^2 \cdot R$) of the original value.
Self-test and auto-configuration	If the user changes the status/position of SW4 twice in 1 second, the drive will self-test the driving motor and auto-configuration control parameters, offering optimum performance with different motors..
Control Signals	PUL+ and PUL- are for the pulse command signal. DIR+ and DIR- are for the direction control signal. ENA+ and ENA- are for the enable/disable control signal. Series connect resistors for current-limiting when +12V or +24V is used.
Motor Connector	U, V, W are for motor connections. Exchanging the connection of two wires to the drive will reverse default motion direction.
Power Connector	Recommended to use power supplies with output of +20 VDC to +48 VDC, leaving room for power fluctuation and back-EMF.
Indicators	There are two LED indicators on the drive for power and alarm signals. When the Green LED is on means the drive is powered up, and when the Red LED is on means the drive is in fault status. When in fault status, the motor shaft will be free. Reset the drive by re-powering it to make it function properly after removing problem(s). See its manual for more information.

Parameter Settings

Microstep resolution and output current are programmable. When not in software configured mode, the drive uses an 8-bit DIP switch to set microstep resolution, and motor operating current, as shown below:

Operating Current Setting

Peak Current	RMS Current	SW1	SW2	SW3
Default (software configured, 0.5-8.3 A)		off	off	off

DM805-AI

Introduction

The DM805-AI is a multi-function digital stepper drive and it belongs to DM series stepper drives. It has all the features that other DM drives have. The DM805-AI is distinguished from other DM series drives by its operating modes. The DM805-AI can be operated in 4 different modes. They are 0-5V speed, low/high speed, external POT and pulse/direction modes.

Three built-in potentiometers can be used to set the velocity, acceleration and deceleration. In 0-5V speed mode, the motor speed follows the analog 0-5V input. In Low/HIGH speed mode, the motor speed is selected by the digital input and adjusted by the high/low speed potentiometers. In pulse/direction mode, the DM805-AI acts as a traditional stepper drive. There is a 5V auxiliary output for customer use. The user can run the motor with the least configuration and connection, without buying an expensive motion controller.

Function Description

Function	Description
Microstep Setting	Microstep resolution is programmable. When not in software configured mode, microstep resolution is set by SW5, 6, 7, 8 of the DIP switch. In order to avoid losing steps, do not change the microstep resolution on the fly.
Current Setting	Output current is programmable. When not in software configured mode, operating current is set by SW1,2,3 of the DIP switch. Up to 8.2 A. Select a current setting closest to your motor's required current.
Automatic standstill current reduction;	SW4 is used for the automatic standstill current reduction, self-test and auto-configuration function. When the former active, the current will automatically reduced to 60% of the selected operating current 0.4 second after the last pulse. Theoretically, this will reduce motor heating to 36% (due to $P=I^2 \cdot R$) of the original value.
Self-test and auto-configuration	If the user changes the status/position of SW4 twice in 1 second, the drive will self-test the driving motor and auto-configuration control parameters, offering optimum performance with different motors.
Control Signals	The DM805-AI is a multi-function digital stepper drive. It can be operated in 0-5V speed, low/high speed, externalPOT and pulse/direction modes. There are 3 potentiometers, 4 digital inputs and 1 analog input can be configured to control the acceleration, speed, position and direction in different modes.
Motor Connector	A+, A- and B+, B- are for motor connections. Exchanging the connection of two wires for a coil to the drive will reverse default motion direction.
Power Connector	Recommended to use power supplies with output of 20 to 80 VDC, leaving room for power fluctuation and back-EMF.
Indicators	There are two LED indicators on the drive for power and alarm signals. When the Green LED is on means the drive is powered up, and when the Red LED is on means the drive is in fault status. When in fault status, the motor shaft will be free. Reset the drive by re-powering it to make it function properly after removing problem(s). See its manual for more information.

Parameter Settings

Microstep resolution, output current and operating mode are programmable. When not in software configured mode, the drive uses an 8-bit DIP switch to set microstep resolution, and motor operating current, as shown below:

Standstill Current (ON half / OFF full)
Self-test and Auto-configuration (2 changes in 1 second)

Operating Current Setting

Peak Current	RMS Current	SW1	SW2	SW3
Default (software configured, 0.5-7.0 A)				
2.6 A	1.8 A	off	off	off
3.4 A	2.4 A	off	on	off
4.0 A	2.8 A	on	on	off
4.8 A	3.4 A	off	off	on

400	off	on
1600	on	off
12800	off	off

Mechanical Specifications

Units: mm 1 inch = 25.4mm

Applications

Particularly suitable for the applications which need to adjust the velocity via the potentiometer or analog 0-5V command. Owing to high torque and super-low motor noise at low speed, stepper solution based on the DM805-AI can be used to replace the brushless motor and gearbox solution, which is used in various kinds of machines, such as rotary heat exchange, conveyor belts, transport vehicle, offering longer life time and lower cost than the later.

Operating Mode Setting

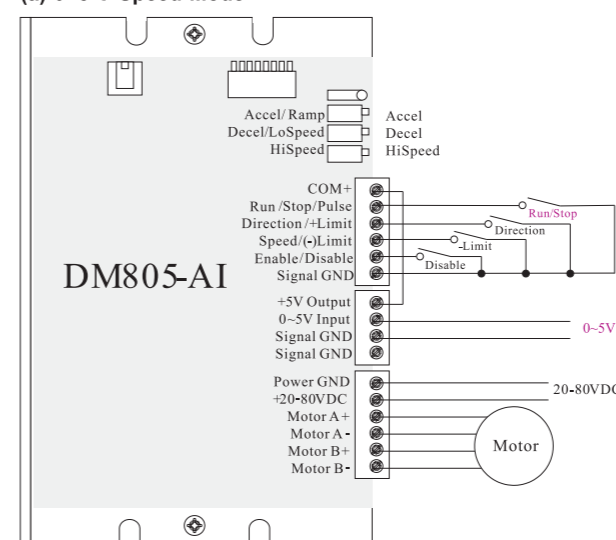

Operating Modes	SW7	SW8	Descriptions
0~5 V Speed	on	on	Speed controlled by the 0~5V, and direction controlled by the direction input.
Low/High Speed	off	on	Speed controlled by the preset low speed and high speed, and direction control by the direction input.
External POT	on	off	Both speed and direction are controlled by the 0~5V. 0~2.5 V, negative direction; 2.5~5V, positive direction.
Pulse/Direction	off	off	Speed and movement distance are controlled by the pulse, and direction controlled by the direction input.

Potentiometer Function in Different Operating Modes

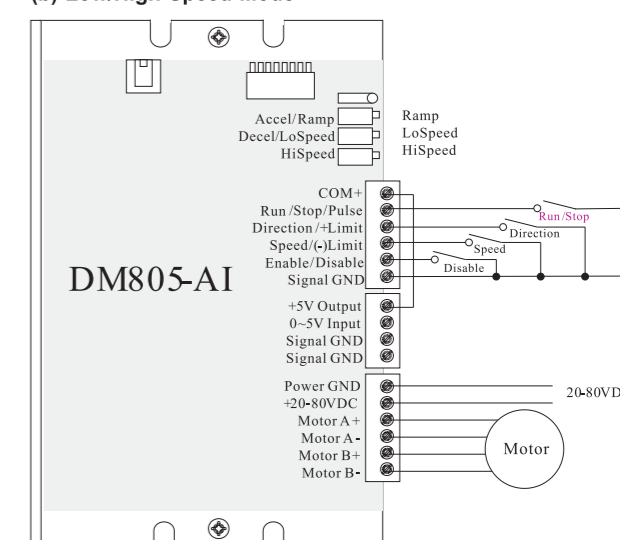

Potentiometers	0~5V Speed Mode	Low/High Speed Mode	External POT Mode	Pulse/Direction Mode
Accel / Ramp	Acceleration	Ramp	Acceleration	N/A
Decel / LoSpeed	Deceleration	Low Speed	Deceleration	N/A
HiSpeed	High Speed	High Speed	High Speed	N/A

Typical Connections

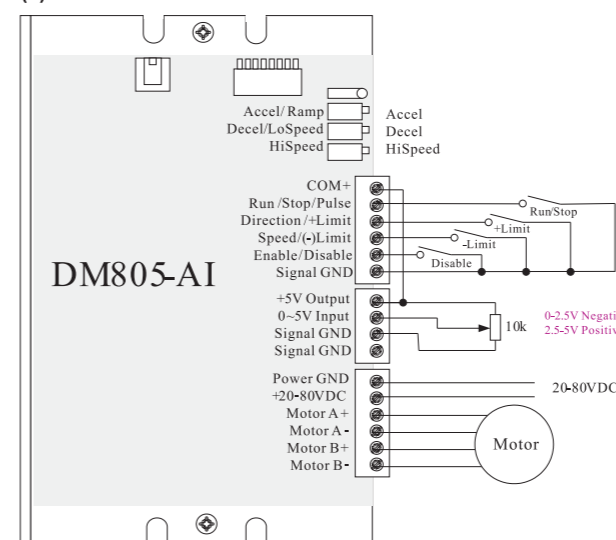

(a) 0~5 V Speed Mode

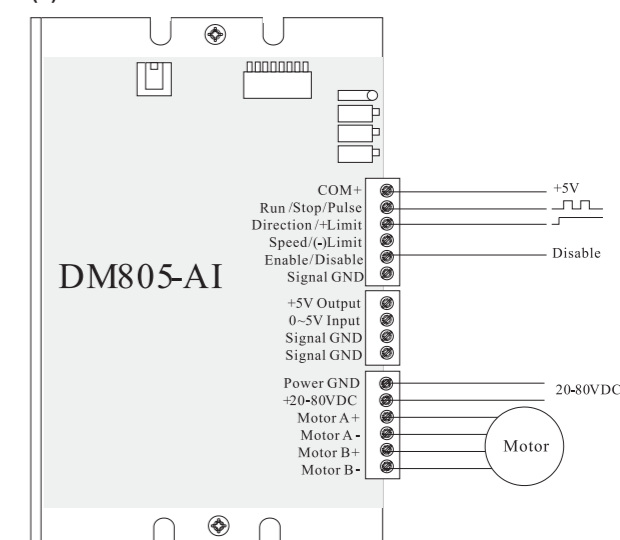

(b) Low/High Speed Mode

(c) External POT Mode

(d) Pulse/Direction Mode

M Series Analog Stepper Drives

Features

- ◆ The 3rd generation of economical high performance stepper drives
- ◆ Self-adjustment technology, providing optimal performance with different motors
- ◆ Precise current control technology with less motor heating
- ◆ 7 models, covering 20 VDC to 112VDC or 18 VAC to 80VAC operating voltage ranges
- ◆ Excellent high-speed performance
- ◆ Smoother movement at low-speed
- ◆ Lower motor noise and heating than most analog stepper drives on the market
- ◆ Replace or upgrade all old M series drives

Introduction

The new M series drives are the latest analog stepper drives Leadshine has developed after more than 12 years R&D experiences. These drives provide better performance and offer higher performance-price ratios. They are the most cost-effective stepper drives on the market.

The new M series stepper drives employ Leadshine's innovative patented control technologies. With the adoption of its pioneer "pure-sinusoidal current control technology" and the latest "self-adjustment technology", those drives can effectively reduce current ripples and mid-range vibration, enabling different motors to run at optimal performance and with lower heating. They can also eliminate drawbacks of difficulty of driving various motors, such as high heating with smaller inductance motors, low high-speed torque with large inductance motors, poor performance under low voltage, and high motor heating under high voltage.

The new M series stepper drives use three digital filters which greatly improve anti-interference performance, and increase the precision and stability of machines.

Application and Position

The new M series includes seven models. DC input models include the M550/M760/M860/M880A, and AC & DC input models include the MA550/MA860/MA860H. Suitable to drive 2-phase stepper motors (form NEMA17 to 42) using in industrial and office automation applications. The AC input models cut cost by using a simpler power supply (ie. a transformer without power rectifier).

Traditional stepper drives

New M series

Much smaller current ripple means lower motor heating (10°C-20°C lower)

Traditional stepper drives

New M series

Pure-sinusoidal current control technology means smoother movement (No creep phenomenon)

Part Number

Selection Table

Model	Models to be Replaced	Output Current (A)	Supply Voltage (V)	Size (mm) Weight (g)	Driving Motors (NEMA Size)	Control Signal	
						PUL/DIR; CW/CCW	Single-ended; Differential
M550	M535, M542, ME542	1.2 to 5.0	20 to 45VDC	118*75.5*34 271	14, 17, 23	PUL/DIR; CW/CCW	Single-ended; Differential
M760	M840, M839, ME742	1.45 to 6.0	20 to 70VDC	118*75.5*34 280	14, 17, 23, 34	PUL/DIR; CW/CCW	Single-ended; Differential
M860 V5.0	M860	2.4 to 7.2	24 to 80VDC	151*97*48 570	17, 23, 34	PUL/DIR; CW/CCW	Single-ended; Differential
M880A	M860, M880, ME872	2.5 to 7.8	24 to 75VDC	151*97*48 565	23, 34, 42	PUL/DIR; CW/CCW	Single-ended; Differential
MA860	M860, M880, MD882	2.4 to 7.2	24 to 60VAC	151*97*48 570	23, 34	PUL/DIR; CW/CCW	Single-ended; Differential
MA860H		2.4 to 7.2	36 to 80VAC	151*97*52 590	34, 42	PUL/DIR; CW/CCW	Single-ended; Differential

Operating Environment and Other Specifications

Cooling	Natural cooling or forced cooling	
	Environment	Avoid dust, oil fog and corrosive gases
Operating Environment	Ambient Temperature	0 to +50 °C
	Humidity	40-90% RH
	Vibration	5.9m/s ² MAX
Storage Temperature	-20 to 125 °C	

Tips

1. Working temperature for M series drives should below 70°C (158°F); and motor working temperature should below 80°C (176°F). Use automatic idle-current function to reduce drive and motor heating when a motor stops. Use forced cooling to cool the system if necessary.
2. To improve anti-interference performance of the system, use twisted pair shielded cable for control signals and correctly ground the system. To prevent noise coupling on pulse/direction signals, pulse/direction signal wires, motor wires and power wires should not be tied up together. Separate them by at least 10 centimeters (4 inches) to avoid disturbing signals generated by a stepper motor, which can easily disturb pulse and direction signals and cause motor position error, system instability and other failures.
3. Don't pull and plug motor or power wires while a stepper drive is powered ON, because there is high current flowing through motor coils (even stopped). Doing that would result in extremely high voltage surge, and could damage the drive.
4. If a power supply serves multiple drives, separately connecting the drives (each in a star arrangements) is recommended instead of daisy-chain arrangement.

Typical stepper System

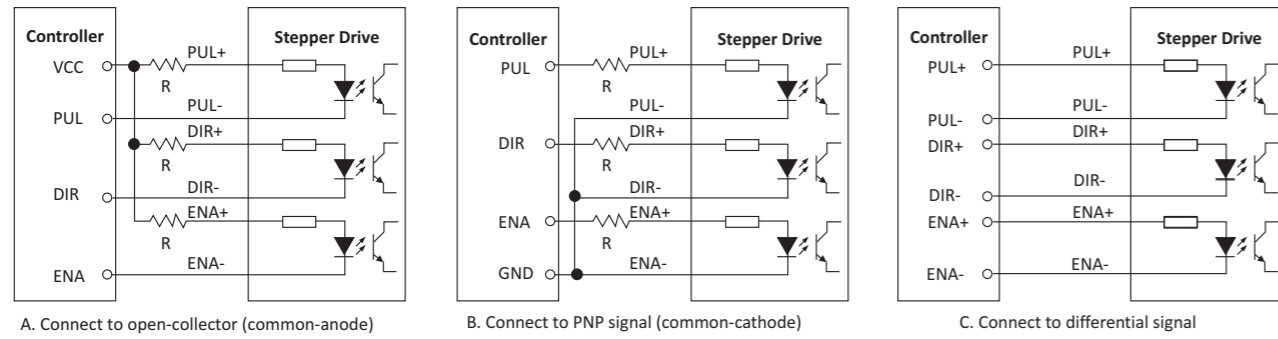

Control Signal Interface and Timing Chart

The M series drives can accept differential and single-ended inputs, including open-collector and PNP signals. The drives have 3 optically isolated logic inputs which are located on connector P1 to accept line driver control signals. The inputs are isolated to minimize or eliminate electrical noises coupling onto the drive control signals. Use line driver control signals to increase noise immunity of a drive in interference environments. In the following figures, connections to open-collector and PNP signals are illustrated. In order to avoid some fault operations and deviations, PUL, DIR and ENA should abide by the timing rules shown in the following timing diagram. Connections and timing diagram of control signals are shown in the following figures.

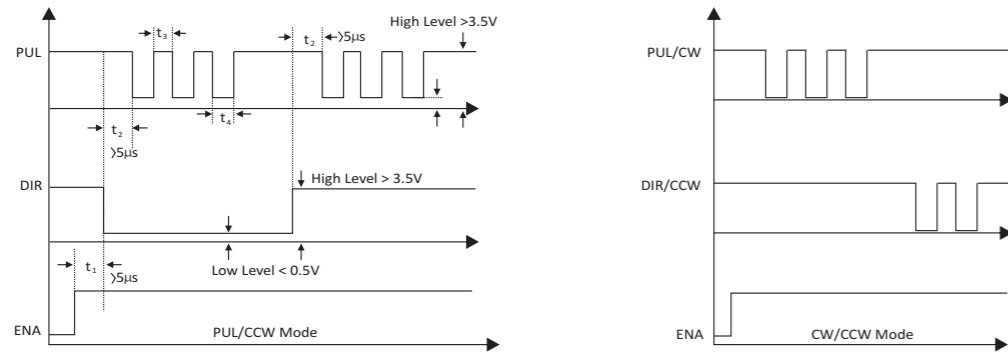

* This model has UL approved version and non-UL approved version.

Control signal connections

Series connect resistors for current-limiting when +12V or +24V used. R=1K (>0.25W) if VCC=12V; R=2K (>0.25W) if VCC=24V. Make sure that the current through the opto-coupler is between 7 mA and 16 mA.

In order to avoid faults in operations, PUL, DIR and ENA signals should abide by the timing rules shown in this timing diagram.

- Notes:
- (a) t1: ENA must be ahead of DIR by at least 5 μs. Usually, ENA+ and ENA- are NC (not connected), drive is enabled.
 - (b) t2: DIR must be ahead of PUL's effective edge by 5 μs to ensure correct direction;
 - (c) t3: High level width not less than 2.5 μs;
 - (d) t4: Low level width not less than 2.5 μs.

Problem Symptoms and Possible Causes

Symptoms	Possible Causes
Motor is not rotating	No power
	No motion command signal
	DIP switch current or microstep resolution setting is wrong
	Fault condition exists
	The drive is disabled
Motor rotates in wrong direction	Drive failure
	Motor phases may be connected in reverse
	Direction control signal may be in reverse
Drive is in fault	Opto-coupler for DIR inputs is broken
	Over voltage protection
Erratic motor motion	Over current protection
	Something wrong with motor coil
	Control signal is too weak or interfered
	Wrong motor connection
Motor stalls during acceleration	Something wrong with motor coil
	Current setting is too small, losing steps
	Current setting is too small, not enough torque
	Motor is undersized for the application
Excessive motor and drive heating	Acceleration is set too high
	Power supply voltage too low
	Inadequate heat sinking / cooling
	Automatic current reduction function not being utilized
	Current is set too high
	Supply voltage too high

iST Integrated Steppers

(Open loop Stepper Systems)

Motor + Drive + Controller + Network

Integrated Steppers

iST Series (Open-loop Stepper Systems)

iST Series Integrated Steppers

Introduction

Leadshine's iST series integrated steppers are one of the most compact stepper systems available on the market. An iST integrated stepper has a stepper motor and an advanced DSP stepper drive. At very compact size and with all components integrated, the iST series steppers can save mounting space, eliminate encoder connection and motor wiring time, reduce interference, and lower cable and labour cost. Owe to its advanced DSP stepper drive, the iST series integrated steppers offer high starting torque, high precision and smooth movement, and super-low noise at low speed movement with no obvious resonance area. The drive takes step & direction commands, and is capable of outputting fault signals back to the master controller or external devices for complete system controls.

Part Number

iST-17 (NEMA17)				
iST-23 (NEMA23)				
iST-23B (NEMA23*)				
iST-24 (NEMA24)				

Please visit Leadshine's website at www.leadshine.com for the latest information about the iST series integrated steppers.

*Higher torque, motor body is NEMA24 while the specifications for mounting are the same as standard NEMA23 motors.

Highly Integrated

Features

- **Highly Integrated**, Stepper motor + advanced DSP stepper drive
- **Super-low** motor noise
- **Anti-Resonance** optimizes torque and nulls mid-range instability
- **Multi-stepping** allows a low resolution input to produce a higher microstep output for smoother system performance
- Options to set output current and microstep resolutions via DIP switch or software
- Command input of PUL/DIR and CW/CCW
- Over-current, over-voltage, short-circuit protections

Specifications

Model	iST-17	iST-23 and iST-23B	iST-24
Operating Voltage (VDC)	24	18 to 48	18 to 70
Holding Torque (Nm)	0.3, 0.4, 0.5 and 0.6	0.9, 1.0, 1.5, 2.0 and 2.5	1.2, 1.8, 2.4 and 3.0
Operation Modes	Step & Direction, RS485 and CANopen		
Maximum Input Frequency (kHz)	500		
Protection Functions	Over-current, Over-voltage		
Inputs	Step & Direction	Step & Direction, Enable (differential)	
	RS485 / CANopen	4 digital inputs, 1 analog input (single-end)	
Outputs	Step & Direction	fault out (differential)	
	RS485 / CANopen	2 digital outputs (open collector)	
Storage Temperature	-20 °C to 80 °C		
Ambient Temperature	0 °C to 50 °C (Heat sink)		
Humidity	40%RH to 90%RH		

Operation Modes

1. Step & Direction

- Support step & direction and CW/CCW pulse commands
- Compatible with 5 to 24 V command signals

2. RS485

- One host up to 32 drives
- Can be used with either 2-wire (half-duplex) or 4-wire RS485 (full-duplex) implementation
- DLL is available for API function calling
- Easy to wire and build multi-axis systems

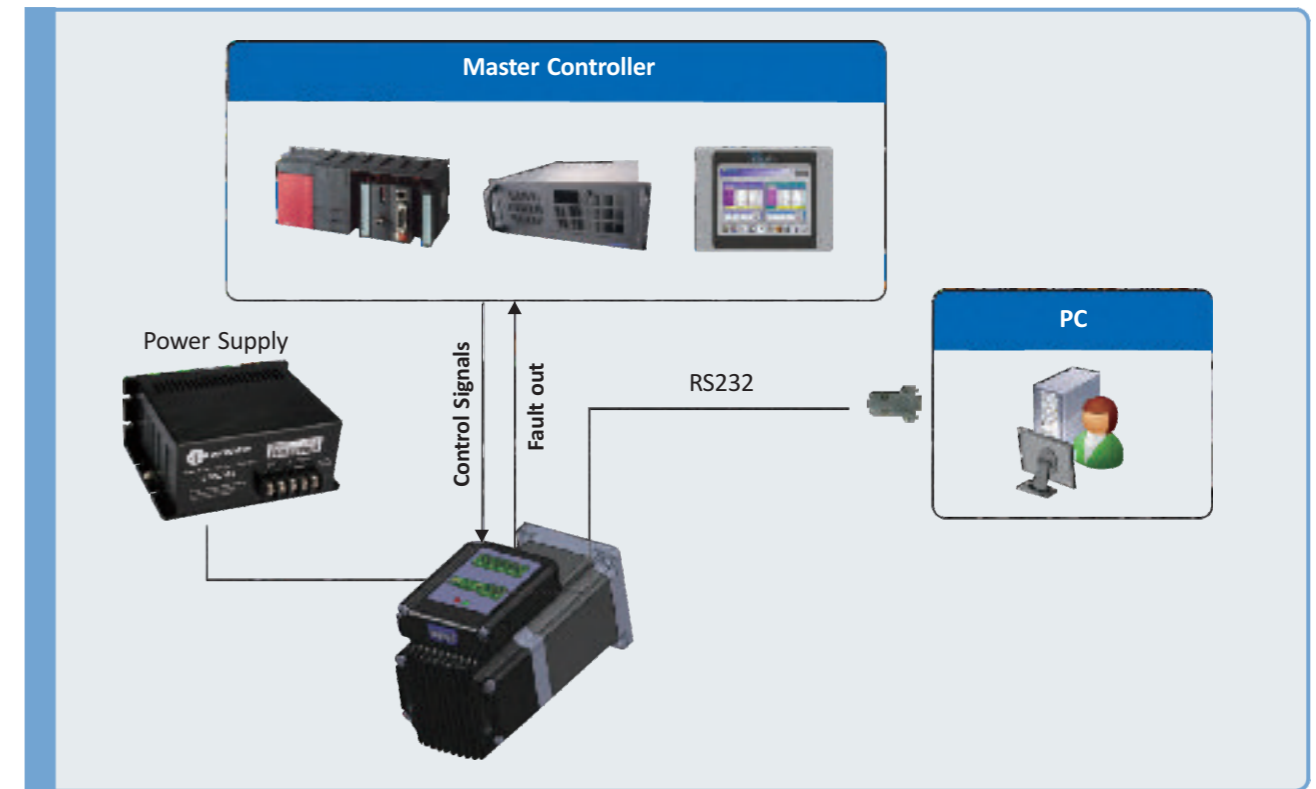

3. CANopen

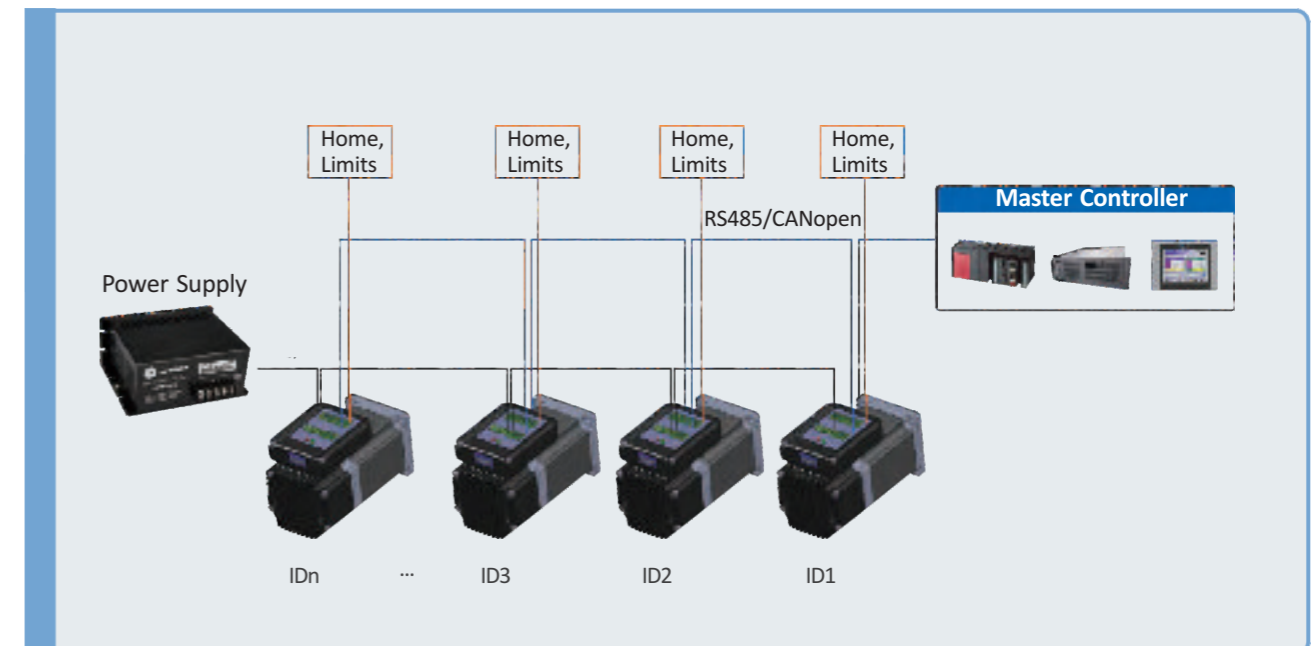

- One host up to 127 drives
- CANopen standards: CiA Standard 301 (DS301), CiA Standard 402 (DSP402)
- Up to 1 Mbit/sec speeds possible
- Easy to wire and build multi-axis systems

Typical System Configurations

1. Step & Direction

2. RS485 and CANopen

Pin Assignment

Model	Step&Direction	RS485	CANopen

Stepper Motor Basic

A stepper motor is an electromechanical device which converts electrical pulses into discrete mechanical movements. The shaft of a stepper motor rotates in discrete step increments when electrical command pulses are applied to it in a proper sequence. The motor rotation has several direct relationships to these applied input pulses. The sequence of the applied pulses is directly related to the direction of motor shafts rotation. The speed of the motor shafts rotation is directly related to the frequency of the input pulses and the length of rotation is directly related to the number of input pulses applied.

A stepper motor can be a good choice whenever controlled movement is required. They can be used in applications where you need to control rotation angle, speed, position and synchronism. Because of the inherent advantages, stepper motors have found their places in many different applications, such as CNC routers, laser machines, and so on.

Stepper Motor Types

There are three basic stepper motor types. They are variable-reluctance, permanent-magnet and hybrid.

Variable-reluctance (VR)

This type of motor consists of a soft iron multi-toothed rotor and a wound stator. When the stator windings are energized with DC current the poles become magnetized. Rotation occurs when the rotor teeth are attracted to the energized stator poles.

Permanent Magnet (PM)

Often referred to as a "tin can" or "canstock" motor, the permanent magnet step motor is a low cost and low resolution type motor. PM motors as the name implies have permanent magnets added to the motor structure. The magnetized rotor poles provide an increased magnetic flux intensity and because of this the PM motor exhibits improved torque characteristics when compared with the VR type.

Hybrid (HB)

The hybrid stepper motor provides better performance with respect to step resolution, torque and speed. The hybrid stepper motor combines the best features of both the PM and VR type stepper motors. The rotor is multi-toothed like the VR motor and contains an axially magnetized concentric magnet around its shaft. This further increases the detent, holding and dynamic torque characteristics of the motor when compared with both the VR and PM types. Generally speaking, the hybrid motor may be the better choice along with reducing cost, for it offers better performance with respect to step resolution, torque and speed.

Normal Selection Steps

You can follow the following steps to choose a stepper motor.

1. Determining the Drive Mechanism Component

Determine the mechanism and required specifications. First, determine certain features of the design, such as mechanism, rough dimensions, distances moved, and positioning period.

2. Calculate the Required Resolution

Find the resolution the motor requires. From the required resolution, determine whether a motor only or a geared motor is to be used. The resolution and positioning accuracy of a stepper motor system is affected by several factors—the stepper angle, the selected drive mode (full-step, half-step or microstepper), and the gear rate.

3. Determine the Operating Pattern

Determine the operating pattern that fulfills the required specifications. Find the acceleration (deceleration) period and operating pulse speed in order to calculate the acceleration torque.

4. Calculate the Required Torque

Calculate the load torque and acceleration torque and find the required torque demanded by the motor.

5. Select the Motor

Make a provisional selection of a motor based on required torque. Determine the motor to be used from the speed-torque characteristics.

6. Check the Selected Motor

Confirm the acceleration/deceleration rate and inertia ratio.

Motor Connections

The M series drives can drive any 2-phase, 4-phase hybrid stepper motors, including 4-lead, 6-lead and 8-lead motors. Step angle of the motors can be 1.8 or 0.9 degree. For 6-lead and 8-lead stepper motors, different connections have different performance shown in the following figures.

Leadshine's Stepper Motors

Leadshine offers 2-phase and 3-phase stepper motors from NEMA14 to NEMA51. Made of high quality cold roll sheet copper and anti-high temperature permanent magnet, these stepper motors are highly reliable and generate low motor heating. Because of their nice internal damping characteristics, those stepper motors can run very smoothly and have no obvious resonance area within the whole speed ranges.

Selection Table

Phase	NEMA Size	Model	Step Angle (°)	# of Leads	Connection	Current/Phase (A)	Holding Torque (Nm)	Length L (mm)	Weight (kg)	Match Drives

Part Number

35HSxx/39HSxx Series

General Specifications

Angle Accuracy	± 5%(full step, no load)
Temperature Rise	80 °C Max
Ambient Temperature	-10 °C — +50 °C
Insulation Resistance	100M Ω min. 500VDC
Dielectric Strength	500VAC for one minute
Shaft Radial Play	0.06 Max. (450g-load)
Shaft Axial Play	0.08 Max. (450g-load)

Selection Table

Phase	NEMA Size	Model	Step Angle (°)	# of Leads	Connection	Current/Phase (A)	Holding Torque (Nm)	Length L (mm)	Weight (kg)	Match Drives
2	14	35HS01	1.8	4	-	0.4	0.07	26	0.15	EM402 / DM422C
	16	39HS02	1.8	4	-	0.6	0.22	34	0.20	EM402 / DM422C

Speed-Torque Curves of 2-phase Stepper Motors

Speed-Torque Curves of 3-phase Stepper Motors

57HS09 57HS13

Stepper Motor: 57HS09 Output Current: 3.8 A(Peak)
Stepper Drive: MD556 Microstep: 1600 PPR
Input Voltage: 36 VDC Connection: Parallel

Stepper Motor: 57HS13 Output Current: 3.8 A(Peak)
Stepper Drive: MD556 Microstep: 2000 PPR
Input Voltage: 36 VDC Connection: Parallel

573S09 573S15

Stepper Motor: 573S09 Output Current: 4.9 A(Peak)
Stepper Drive: 3MD560 Microstep: 2000 PPR
Input Voltage: 36 VDC Connection: Delta

Stepper Motor: 573S15 Output Current: 7.7 A(Peak)
Stepper Drive: 3MD560 Microstep: 2000 PPR
Input Voltage: 36 VDC Connection: Delta

57HS22 86HS45

Stepper Motor: 57HS22 Output Current: 5.6 A(Peak)
Stepper Drive: MD556 Microstep: 2000 PPR
Input Voltage: 36 VDC Connection: Parallel

Stepper Motor: 86HS45 Output Current: 8.2 A(Peak)
Stepper Drive: MD882 Microstep: 2000 PPR
Input Voltage: 64 VDC Connection: Parallel

863S22 863S42

Stepper Motor: 863S22 Output Current: 6.6 A(Peak)
Stepper Drive: 3ND883 Microstep: 2000 PPR
Input Voltage: 64 VDC Connection: Delta

Stepper Motor: 863S42 Output Current: 7.4 A(Peak)
Stepper Drive: 3ND883 Microstep: 2000 PPR
Input Voltage: 64 VDC Connection: Delta

86HS85 110HS20

Stepper Motor: 86HS85 Output Current: 7.3 A (Peak)
Stepper Drive: MD882 Microstep: 3200 PPR
Input Voltage: 68 VDC Connection: Parallel

Stepper Motor: 110HS20 Output Current: 7.8 A (Peak)
Stepper Drive: MD2278 Microstep: 400 PPR
Input Voltage: 110 VAC Connection: Parallel

863S68H

Stepper Motor: 863S68H Output Current: 3.36 A(Peak)
Stepper Drive: 3MD2380 Microstep: 2000 PPR
Input Voltage: 220 VAC Connection: Delta
